# “What is a Group?” — Question posed to 7 year old

Terry Tao.

**M.A.C.:** What is a group?

**T.T.:** A set which is mapped onto itself by a binary operation: The binary operation is associative, and the set has an identity  $e$  such that  $e \times x$  equals  $x$  for all  $x$  in the set. Also, for each  $x$  in the set there is an inverse  $x'$  in the set such that  $x' * x$  equals  $e$ .

Consider motion of a point  $q$  on a rotating link

$$\begin{cases} \dot{q}(t) = \omega \times q(t) = \hat{\omega}q(t) \\ q(0): \text{Initial coordinates} \end{cases}$$

$$\Rightarrow q(t) = e^{\hat{\omega}t} q_0 \text{ where } e^{\hat{\omega}t} = I + \hat{\omega}t + \frac{(\hat{\omega}t)^2}{2!} + \frac{(\hat{\omega}t)^3}{3!} + \dots$$

By the definition of rigid transformation,  $R(\omega, \theta) = e^{\hat{\omega}\theta}$ . Let  $so(3) = \{\hat{\omega} | \omega \in \mathbb{R}^3\}$  or  $so(n) = \{S \in \mathbb{R}^{n \times n} | S^T = -S\}$  where  $\wedge : \mathbb{R}^3 \mapsto so(3) : \omega \mapsto \hat{\omega}$ , we have:

**Property 3:**  $\exp : so(3) \mapsto SO(3), \hat{\omega}\theta \mapsto e^{\hat{\omega}\theta}$

**Rodrigues' formula** ( $\|\omega\| = 1$ ):

$$e^{\hat{\omega}\theta} = I + \hat{\omega} \sin \theta + \hat{\omega}^2 (1 - \cos \theta)$$

## Chapter 2 Rigid Body Motion

### 1 Rigid Body Transformations

- Length Preserving:  $\|g(p) - g(q)\| = \|p - q\|$
- Orientation Preserving:  $g_*(v \times w) = g_*(v) \times g_*(w)$

### 2 Rotational motion in $\mathbb{R}^3$

- Rotation Matrix
  - Represents *configuration*
  - Represents (*rotational*) *transformation*
- Rotation Matrices with matrix multiplication form a *Group*
- Rotational Transformation is a *Rigid Body Transformation*
